

Supplementary Figure 2. Confocal microscopy of Tn mutants at 24, 36, and 42hpi. L929 cells were infected with WT and mutant *C. trachomatis* at 24, 36, or 42 hpi. Samples were stained with DAPI (blue), and a *C. trachomatis* Culture Confirmation Test for MOMP (green), and host cytosol (red). Images were captured at 150X magnification with single z-plane displayed. Scale bar = 10μm and is consistent within time points.
